# New Zealand's Future Landscapes: What's Possible, What's the Impact, & What's Holding us Back?

Brent Clothier & friends

# The Productivity Commission on ...

NEW ZEALAND  
PRODUCTIVITY COMMISSION  
Te Kōwhiriwhiri Whai Hua o Aotearoa

Low-emissions  
economy

August 2018

“Growth in horticulture will play a significant role in reducing agricultural emissions”

“A well-designed and stable Emissions Trading Scheme (ETS) will incentivise land-use change”

# Agricultural Greenhouse Gas Emissions

Figure 11-1 Indicative yearly biological emissions per hectare from different land uses

Source: Clothier et al. (2017); Reisinger et al. (2017); Tate et al. (1997).

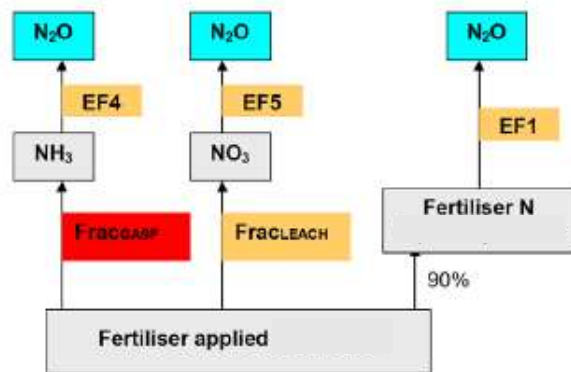

# The Productivity Commission Recommends ...

**R11.2**

Agricultural nitrous oxide emissions should be fully included in the New Zealand Emissions Trading Scheme (NZ ETS). Agricultural methane emissions should be fully included in the NZ ETS if that is the option recommended by the Interim Climate Change Committee in its report to Government due at the end of April 2019.

## Direct & Indirect N<sub>2</sub>O Emissions from Fertiliser

## N<sub>2</sub>O Emissions from Prunings

$$N_{2O} \text{direct crop residue-N} = TRG_N \times EF_1 \times 44 / 28 \times 10^6$$

$TRG_N$  = Total amount of nitrogen returned to soils from crop residue.

|   | Kiwifruit | Apples | Grapes |
|---|-----------|--------|--------|
| Fertiliser N<br>[kg-N ha <sup>-1</sup> y <sup>-1</sup> ]                        | 130       | 40     | 5      |
| Pruning N<br>[kg-N ha <sup>-1</sup> y <sup>-1</sup> ]                           | 70        | 105    | 30     |
| Biological Emissions<br>[T CO <sub>2-e</sub> ha <sup>-1</sup> y <sup>-1</sup> ] | 1.03      | 0.71   | 0.17   |

# Profitability (EBIT) of Horticulture.

Kiwifruit: Green \$15-18,000 ha<sup>-1</sup> Gold  $\approx$  \$50,000 ha<sup>-1</sup>

Grapes: \$6-10,000 ha<sup>-1</sup>

Apples: \$15-20,000 ha<sup>-1</sup>

Let's say for a heuristic exercise that ...

... the average EBIT for horticulture is **\$10,000 ha<sup>-1</sup>**

What's the impact of a putative \$50 T<sub>CO<sub>2-e</sub></sub> price on horticultural EBIT?

|           | Biological GHG Emissions<br>[T CO <sub>2-e</sub> ha <sup>-1</sup> ] | Areal Cost @<br>\$50 T CO <sub>2-e</sub><br>[\$ ha <sup>-1</sup> ] | EBIT<br>[\$ ha <sup>-1</sup> ] | Carbon<br>cost/EBIT<br>[%] |
|-----------|---|--|--------------------------------|----------------------------|
| Kiwifruit | 1.03  | 51.50  | 10,000                         | 0.51%                      |
| Apples    | 0.71  | 35.50  | 10,000                         | 0.36%                      |
| Grapes    | 0.17  | 8.50   | 10,000                         | 0.09%                      |

Few risks, it would seem, from the Zero Carbon Bill ...

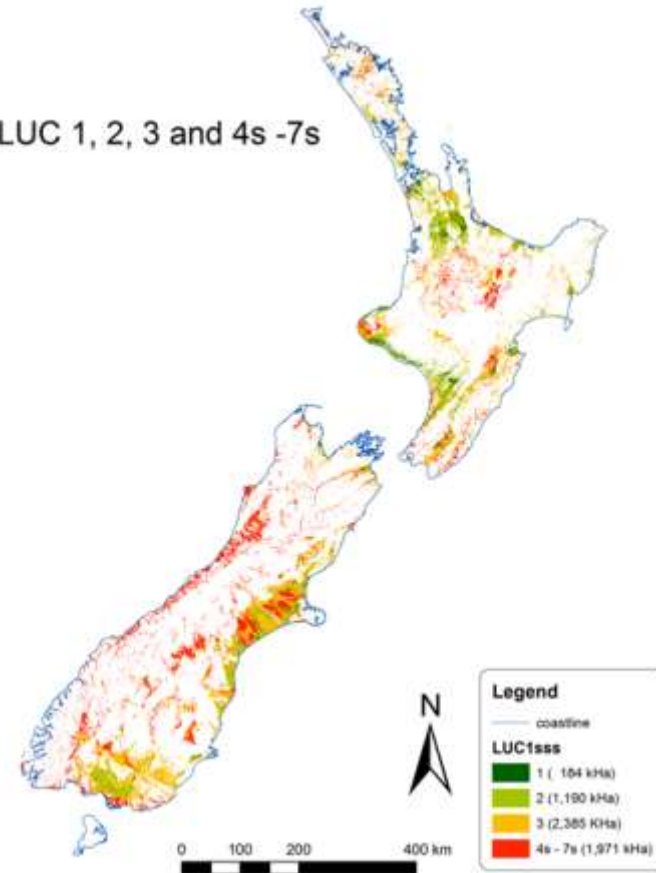

.... & an effective ETS.

# Where are the Natural Capital Assets that could support Horticulture?

Horticulture requires 'flat' land ( $<5^\circ$ )

LUC 1, 2, 3 and 4s -7s

... and relies on the better Land Use Capability (LUC) classes

# Horticulture Requires an Equable Climate

For fruit maturation,  
growing degree days (base  
10)  $GDD_{10}$  should exceed 800

$GDD_{10} \Rightarrow 800$

Derived ffp  $\geq 180$

... & there should be a frost-free period (ffp) of over 180 days to enable flowering & fruit maturation

# The Intersection is the Potential Area for Horticulture in the Future

LUC 1, 2, 3 & 4s-7s

Slope < 5 °

GDD<sub>10</sub> > 800 degree days

FFP > 180 days

In sum, that's 2,097,000 ha.

That's over 17 times the  
current horticultural area.

# Barriers to Land-Use Change

## Box 10.1

Ample land is available that is biophysically suitable for horticulture, though economic suitability would depend on a combination of commodity prices, water resources, market capacity, and availability of skills. (Clothier et al. 2017)

[&] ... Lack of information was a barrier for Maori landowners changing (Tanira Kingi).

## Some questions for starters ...

- Why do New Zealand's landscapes look like they do?
- What are the barriers to land-use change?
- What might New Zealand's landscapes look like in the future?
- What new knowledge is needed to understand land-use changes?
- What will be the impacts on NZ's terms-of-trade, farm profitabilities, water quantity, water quality, GHG emissions, & climate-change mitigations?
